

Stabilisation and Recycling existing pavements

- * Guaranteed cost efficiency
- * High production rates improve construction expediency
- * Increases Sub-grade strength and consistency
- * Reduce permeability, Linear shrinkage and PI
- * Convert saturated sites into working platforms within 24 hours
- * Embankment, Channel and Dam lining
- * Runways, Highways, Carpark, upgrading of unsealed roads, shoulders and mining haul roads
- * Stabilising is the spreading of various binders, homogenous mixing, moisture conditioning and compaction of any sub-grade or pavement material. This significantly improves density, moisture content, strength (CBR%), plasticity index, Permeability, shrink / swell and dispersive nature of clay

Stabilco is 100% Australian owned and operated and is part of the longest running stabilising company in Australia.

Pulverising and Recycling existing pavements

Wet Mixing and Moisture Conditioning of pavements

- * Guaranteed cost efficiency
- * High production rates improve construction expediency
- * Reconstituting existing pavements reduces the environmental impact of road construction thus reducing your carbon footprint
- * The addition of moisture into the pavement called "wet mixing" using our specialised equipment, not only gives a more uniform and consistent mix compared to more conventional methods but with the direct injection of water into the mixing chamber of a stabilising machine the amount of evaporation and run off is minimised reducing the amount of water needed by up to 50%
- * Also reduces the pressures on quarry material
